

# CUI Abbottabad

Department of Computer Science

## Web Technologies

Lecture-4-Part3-[CLO-2]

HTML-Part5

Teacher: Bushra Mushtaq

# Agenda

---

- ❖ HTML5 and its features
- ❖ New Attributes in HTML
- ❖ HTML5 Form Input Types

# BASIC FEATURES OF HTML

---

**Dear Students:** here are basic features of Html till HTML 4.0 you have that already learned so far:

## HTML:

- ▶ Consist of tags in angle brackets <>
- ▶ Tags are building blocks for website development
- ▶ Web browser process Html tags and display web page accordingly
- ▶ Allows to embed images, CSS, client side scripting and server side scripting,
- ▶ Does not have built-in support for animation, dynamic objects, multimedia, audio/video, embedded games, exception handling
- ▶ Is supported fully by all browsers till html4.0
- ▶ Not able to run with cross platform mobile devices

# HTML5

---

- is fifth revision of Html
- supports all tags already build till html4.0
- introduces number of new tags/elements too
- added more attributes in existing tags/elements
- Build to run with cross platform mobile devices
- Now lets see in detail about some major features of html5 which are not supported by earlier versions of html.

# FEATURES AND COMPARISON OF HTML 5 WITH EARLIER VERSIONS

## 1. Clear Syntax

Unlike Html 4.0 you don't have to write a longer doctype declaration as shown in figure 10.1.

Figure 4.1

In html5 ,You just need to write `<!DOCTYPE html>` in start of html source code before `<html>` tag start.

# FEATURES AND COMPARISON OF HTML 5 WITH EARLIER VERSIONS

---

## 2. Compatibility with browsers

- ▶ Html 5.0 is still not supported by number of browsers because it is not standardized yet.
- ▶ Except IE(Internet Explorer) most other started supporting major functionality of Html 5.0.

Figure 4.2

# FEATURES AND COMPARISON OF HTML 5 WITH EARLIER VERSIONS

---

## 3. New Tags/Elements

- ▶ Html 5.0 introduces number of new types of tag.
- ▶ These tags related to:
  - ▶ Form Input controls
  - ▶ Datalist control
  - ▶ Page Structure Elements
  - ▶ image :[unmatchedstyle.com](http://unmatchedstyle.com)

## 4. Addition of new attributes in existing Tags/Elements

- ▶ Html 5.0 introduces number of new attributes for the performance of existing tag.

**Note:** Details of new tags and attributes will be discussed in current and upcoming lecture

# FEATURES AND COMPARISON OF HTML 5 WITH EARLIER VERSIONS

---

## 5. Error/Exception Handling

- In html 4.0 we have concept of tag soup where we can write code with errors and later correct it into a valid document. The only problem is that it is not standardized, so you need to test it on different browsers.
- However in Html 5 we have detailed rules for lexing and parsing of document(proper syntax checking), so that different browsers will give same error in case of error or incorrect code.
- For HTML 5 The World Wide Web Consortium (W3C) provides a **validation service** (at [validator.w3.org](http://validator.w3.org)) for checking a document's syntax. Sample of such validation process is given in figure 4.3

# FEATURES AND COMPARISON OF HTML 5 WITH EARLIER VERSIONS

Error checking in validator.w3.org

Figure 4.3

# FEATURES AND COMPARISON OF HTML 5 WITH EARLIER VERSIONS

## 6. Multimedia and Dynamic Contents

- ▶ Html 5 includes inbuilt features of multimedia and dynamic contents, which include audio, video, video games etc that can be directly played within the webpages

Figure 4.4

- ▶ Hence in html 5 we do not need third party software like Flash, adobe photoshope etc for the audio/video or dynamic objects.

# FEATURES AND COMPARISON OF HTML 5 WITH EARLIER VERSIONS

---

- ▶ Html 5 still has a way to go and definitely it is the future for dynamic and interactive web pages.
- ▶ As more and more apps are getting built for smartphone and handheld devices , it is a future technology every web developer should be equipped with.
- ▶ Once Html 5 will be standardized more and more browser start supporting it and make developer job easier with coding and compatibility.

# IMPORTANT TO KNOW

---

**Dear Students:** Before we start details of new input types, attributes and page structures elements, you must be aware that:

- ▶ supports for these feature varies among browsers
- ▶ Some feature may be supported by one browser but may be not by other browser, hence
- ▶ For sample outputs I used variety of browsers
- ▶ As new elements in html are increasing day by day, here I am presenting recent and most required list of features till html5

# IMPORTANT TO KNOW

---

## Dear Students:

- ▶ We do not study yet java script or server side script like PHP so we cannot write any target program in java script or php to capture the form data in target program.
- ▶ But as forms are submitted to either client side scripting page(example mypage.js) or server side scripting page(example mypage.php etc). So I only give name of php page. Actual page is not created.

## ONE ASSUMPTION

# IMPORTANT TO KNOW

---

Dear Students:

- ▶ Hence in all sample example I put the target file name as “action.php”.

`<form action="/action.php" method="post">`

- ▶ but all of you must remember that on pressing the submit button “page cannot found” page will be displayed at this stage. But in future we will put proper coding of java script or php for its processing.

## ONE ASSUMPTION

# NEW FORM INPUT TYPES IN HTML5

---

1. color
2. date
3. datetime
4. datetime-local
5. email
6. month
7. number
8. range
9. search
10. tel
11. time
12. url
13. Week
14. file

# COMMON ATTRIBUTES

---

- ▶ Here are attributes which can be used in number of Form Input Types in the same manner:
  - ▶ **id:** is used to identify the input field in client side scripting and in CSS
  - ▶ **name:** is used to identify the input field at server side after form submission
  - ▶ **value:** is used to specify an initial value for an input field
  - ▶ **min:** specify the minimum value for an input field
  - ▶ **max:** specify the maximum value for an input field
  - ▶ **autofocus:** specifies that an input field should automatically get focus when the page loads
  - ▶ **autocomplete:** specifies whether a form or an input field should have autocomplete on or off
  - ▶ **disabled:** specifies that an input field should be disabled
  - ▶ **readonly:** specifies that an input field is read-only

# COMMON ATTRIBUTES

---

- ▶ **size:** specifies a regular expression that the input field's value is checked against, when the form is submitted
- ▶ **multiple:** specified that a user is allowed to enter more than one value in an input field.
- ▶ **required:** specifies that an input field must be filled out before submitting the form
- ▶ **step:** specifies the legal number intervals for an input field
- ▶ **placeholder:** specifies short a hint that describes the expected value of an input field (a sample value or a short description of the expected format).
- ▶ **pattern:** specifies a regular expression that the input field's value is checked against, when the form is submitted

# COMMON ATTRIBUTES → INPUT TYPES

Table-4.1

Attribute Name	Form Input Type Names
<b>id</b>	All form input types
<b>Name</b>	All form input types
<b>value</b>	color, date, range, search, tel
<b>min</b>	number, range, date, datetime-local, month, time, week
<b>multiple</b>	Email, file
<b>max</b>	number, range, date, datetime-local, month, time, week
<b>autofocus</b>	All form elements but in one form apply to only on form element
<b>Autocomplete</b>	Form, Text, color, search, url, tel, email, password, datepicker, range

## Common attributes → Input types

Attribute Name	Form Input Type Names
<b>Disabled</b>	All form input types
<b>readonly</b>	All form input types
<b>size</b>	Text, search, tel, url, email, password
<b>required</b>	Text, search, tel, url, email, password, date picker, number, checkbox, radio, file
<b>step</b>	Number, date, range, datetime-local, month, time, week
<b>Placeholder</b>	Text, search, tel, url, email, password
<b>Pattern</b>	Text, date, search, url, tel, email, password

Table-4.2

# 1. FORM INPUT TYPE- COLOR

---

- ▶ The color type is used for input fields that should contain a color
- ▶ The color input type enables the user to enter a color

## Syntax:

**<input type="color" value="number in hexadecimal">**

- ▶ Depending on browser support, a color picker may/may not appear in the input field.
- ▶ Other common attributes id, name, value, autofocus, autocomplete, disabled and readonly can be used in input type color ( as shown in table 4.1 and 4.2)
- ▶ Now in next, I write a simple program for color display and run in two browsers.

# 1. FORM INPUT TYPE- COLOR

Google Chrome supports color input type

```
colorPicker - Notepad
File Edit Format View Help
<!DOCTYPE html>
<html>
<body>

<h2>Show a Color Picker</h2>

<p>The <strong>input type="color"</strong> is used for input fields that should contain a color.</p>

<form action="/action_page.php">
  <label for="favcolor">Select your favorite color:</label>

  <input type="color" id="favcolor" name="favcolor" value="#1E90FF">

  <input type="submit" value="Submit">
</form>

<p><b>Note:</b> type="color" is not supported in Internet Explorer 21H1 or Safari 9.1 (or earlier).</p>

</body>
</html>
```

Hexadecimal number value for color to be displayed

Listing 4.1-colorPicker.html

Recent Internet Explorer 21H1 does not support input type color

## 2. FORM INPUT TYPE- DATE

---

- ▶ The input type date is used for input fields that should contain a date
- ▶ The date input type enables the user to enter a date in yyyy-mm-dd pattern through up-down spinner control

### Syntax:

**<input type="date" value="number in hexadecimal">**

- ▶ Depending on browser support, a date picker may/may not appear in the input field.
- ▶ Other common attributes id, name, value, autofocus, min, max, disabled, readonly, required, step and pattern can be used in input type date ( as shown in table 10.1 and 10.2)
- ▶ Now in next I write a simple program for date display and run in google chrome and IE browsers.

## 2. FORM INPUT TYPE- DATE

Chrome and Microsoft Edge supports “date” input type but both IE version 21H1 and Safari 9.1 or earlier does not support it

```
*datePicker - Notepad
File Edit Format View Help
<!DOCTYPE html>
<html>
<body>

<h2>Show a Date Picker</h2>

<p>The <strong>input type="date"</strong> is used for input fields that should contain a date.</p>

<form action="/action_page.php">
<p> <label for="birthDate">Enter your Date of Birth:</label>

    <input type="date" id="birthDate" name="birthDate" />YYYY-MM-DD</label></p>

<input type="submit" value="Submit">
</form>

<p><b>Note:</b> type="date" is not supported in Internet Explorer version 21H1 or Safari 9.1 (or earlier).</p>

</body>
</html>
```

Listing 4.2-datePicker.html

## 2. FORM INPUT TYPE- DATE

### Listing 4.3 --- Date with max and min attribute restriction

```
date-with-restriction - Notepad
File Edit Format View Help
<!DOCTYPE html>
<html>
<body>

<h2>Date Field Restrictions</h2>

<p><font color="red">Use the min and max attributes to add restrictions to dates:</font></p>

<form action="/action_page.php">
  <label for="datemax">Enter a date before 1995-01-01:</label>

  <input type="date" id="datemax" name="datemax" max="1994-12-31"><br/><br/>

  <label for="datemin">Enter a date after 2010-01-01:</label>

  <input type="date" id="datemin" name="datemin" min="2010-01-02"><br/><br/>

  <input type="submit" value="Submit">
</form>

<p><strong>Note:</strong> type="date" is not supported in Safari or Internet Explorer 11 (or earlier).</p>

</body>
</html>
```

Date with max restriction

Validation check error of max and min date restriction

Date with min restriction

Listing 4.3 date-with-restriction.html

# SELF VALIDATION IN FORM INPUT TYPES

---

- ▶ The new HTML 5 input types are self validating on the client side, eliminating the need to add complicated JavaScript code to your web pages to validate user input.
- ▶ Self validation is reducing the amount of invalid data submitted
- ▶ Hence, consequently reducing Internet traffic between the server and the client to correct invalid input.

# HOW TO AVOID SELF VALIDATION?

---

Dear Students:

- ▶ If you want that no validation done by form input controls at client side, that is if you want to bypass validation process at client side and you want that validation done at server side then:
- ▶ You have to put **formnovalidate** attribute inside input type **submit**:

```
<input type = "submit" value="Submit" formnovalidate />
```

### 3. FORM INPUT TYPE- DATETIME

---

- i. The datetime input type enables the user to enter a date (year, month, day), time (hour, minute, second, fraction of a second) and the time zone set to UTC (Coordinated Universal Time or Universal Time, Coordinated).

#### Syntax:

**<input type="datetime" value="number in hexadecimal">**

- ▶ Depending on browser support, a date/time picker may/may not appear in the input field.
- ▶ Other common attributes id, name, value, autofocus, min, max, disabled, readonly, required, step and pattern can be used in input type datetime ( as shown in table 4.1 and 4.2)
- ▶ Currently, IE, google chrome, Firefox and safari do not support datetime, hence they render datetime as a text field
- ▶ Now in next I write a simple program for datetime display and run in google chrome browser.

### 3. FORM INPUT TYPE- DATETIME

Google Chrome version 106,  
Microsoft Edge and IE 21H1  
or earlier does not support it

```
*dateTimePicker - Notepad
File Edit Format View Help
<!DOCTYPE html>
<html>
<body>

<h2>Show a Date Time Picker</h2>

<p>The <strong>input type="datetime"</strong> is used for input fields that should contain a date and time.</p>

<form action="/action_page.php">
<p> <label for="DateTime">Enter your Date and Time of Cricket Match:

    <input type="datetime" id="DateTime" name="DateTime" />
    (yyyy-mm-ddThh:mm+ff.gg, such as 2012-01-27T03:15)</label></p>

<input type="submit" value="Submit">
</form>

<p><b>Note:</b> type="datetime" is not supported by Google chrome,| Internet Explorer 21H1 or Safari 9.1 (or earlier).</p>

</body>
</html>
```

Listing 4.4 dateTimePicker.html

## 4. FORM INPUT TYPE- DATETIME-LOCAL

---

- ▶ The datetime-local input type enables the user to enter a date and time in a single control. 
- ▶ The date is selected through up-down spinner as year, day, month hour, minutes, seconds and fraction of seconds (yyyy-mm-dd hh:mm AM/PM)

### Syntax:

**<input type="datetime-local" value="number in hexadecimal">**

- ▶ Depending on browser support, a date/time picker may/may not appear in the input field.
- ▶ Other common attributes id, name, value, autofocus, min, max, disabled, readonly, required and step can be used in input type datetime-local ( as shown in table 4.1 and 4.2)
- ▶ Currently, IE, Firefox and Safari do not support datetime-local hence they render datetime as a text field
- ▶ Now in next I write a simple program for datetime-local display and run in google chrome browser.

## 4. FORM INPUT TYPE- DATETIME-LOCAL

Chrome and Microsoft Edge supports “datetime-local” input type but both IE version 21H1 and Safari 9.1 or earlier does not support it

\*dateTImelocalPicker - Notepad

File Edit Format View Help

```
<!DOCTYPE html>
```

```
<html>
```

```
<body>
```

```
<h2>Local Date Field</h2>
```

```
<p>The <strong>input type="datetime-local"</strong> specifies a date and time input field, with no time zone.</p>
```

```
<p>
```

```
<form action="/action_page.php">
```

```
<label for="birthdaytime">Birthday (date and time):
```

```
<input type="datetime-local" id="birthdaytime" name="birthdaytime">
```

```
(yyyy-dd-mm hh:mm AM/PM)
```

```
</label></p>
```

```
<input type="submit" value="Submit">
```

```
</form>
```

```
<p><strong>Note:</strong> type="datetime-local" is not supported in Firefox, Safari or Internet Explorer 21H1 (or earlier).</p>
```

```
</body>
```

```
</html>
```

Listing 4.5 dateTImelocalPicker.html

30

## 5. FORM INPUT TYPE-EMAIL

---

- ▶ The email input type enables the user to enter an e-mail address or a list of e-mail addresses separated by commas (if the multiple attribute is specified).
- ▶ Depending on browser's support the email address is automatically validated (check its format only) when submitted. Figure 4.1
- ▶ Browser cannot check whether the entered email is exists or not

### Syntax:

**<input type="email" >**

- ▶ Other common attributes id, name, multiple, autofocus, autocomplete, disabled, readonly, required, size, placeholder and pattern can be used in input type email ( as shown in table 4.1 and 4.2)
- ▶ Some smartphones recognize the email type, and add ".com" to the keyboard to match email input.
- ▶ Both IE-11 and google chrome support email type
- ▶ Now in next I write a simple program for email display and run in google chrome and IE-11 browser

## 5. FORM INPUT TYPE-EMAIL

```
email - Notepad
File Edit Format View Help
<!DOCTYPE html>
<html>
<body>

<h2>Email Field</h2>

<p>The <strong>input type="email"</strong> is used for input fields that should contain an e-mail address:</p>

<form action="/action_page.php">
  <label for="email">Enter your valid email address email:
  <input type="email" id="email" name="email"> linke: name@domain.com</label><br/><br/>
  <input type="submit" value="Submit">
</form>

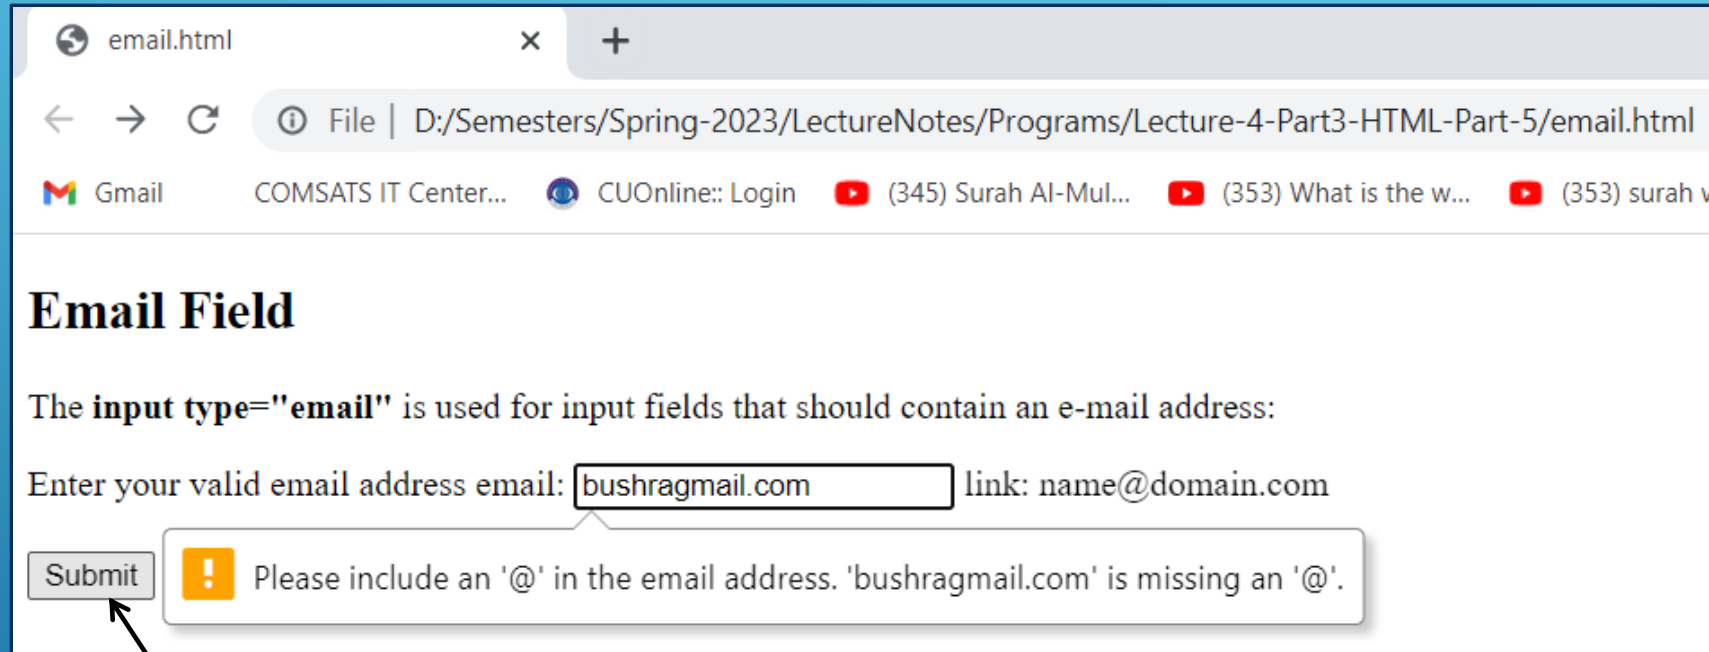

</body>
</html>
```

Listing 4.6 email.html

# 5. FORM INPUT TYPE-EMAIL

Output by Google chrome-listing 4.6

The screenshot shows a web browser window with the title "email.html". The address bar displays the file path: "D:/Semesters/Spring-2023/LectureNotes/Programs/Lecture-4-Part3-HTML-Part-5/email.html". The browser's tab bar shows several open tabs, including "Gmail", "COMSATS IT Center...", "CUOnline:: Login", and two YouTube tabs. The main content area is titled "Email Field" and contains the text: "The **input type='email'** is used for input fields that should contain an e-mail address:". Below this, there is a form with the label "Enter your valid email address email:" followed by an input field containing "bushragmail.com" and a link "link: name@domain.com". A "Submit" button is located below the input field. An error message box is displayed below the input field, containing an exclamation mark icon and the text: "Please include an '@' in the email address. 'bushragmail.com' is missing an '@'.".

Figure 4.1

User clicked submit button then browser check the invalid email format and displayed the error message

# 5. FORM INPUT TYPE-EMAIL

Listing-4.7 use of “placeholder”, “multiple” and “required” attributes in **email** input type.

```
email_with_other_attributes - Notepad
File Edit Format View Help
<!DOCTYPE html>
<html>
<body>

<h2>Email Field with <font color="green">placeholder, multiple</font> and<font color="green"> required</font> attributes</h2>

<p>The <strong>input type="email" </strong> is used for input fields that should contain an e-mail address:</p>

<form action="/action_page.php">
  <label for="email">Enter your valid email address email:

  <input type="email" id="email" name="email" placeholder="name@domain.com" multiple required> linke: name@domain.com</label><br/><br/>
  <input type="submit" value="Submit">
</form>

</body>
</html>
```

Listing 4.7-email with other attributes.html

# 5. FORM INPUT TYPE-EMAIL

Output-Listing-4.7 use of “placeholder” attribute in email input type.

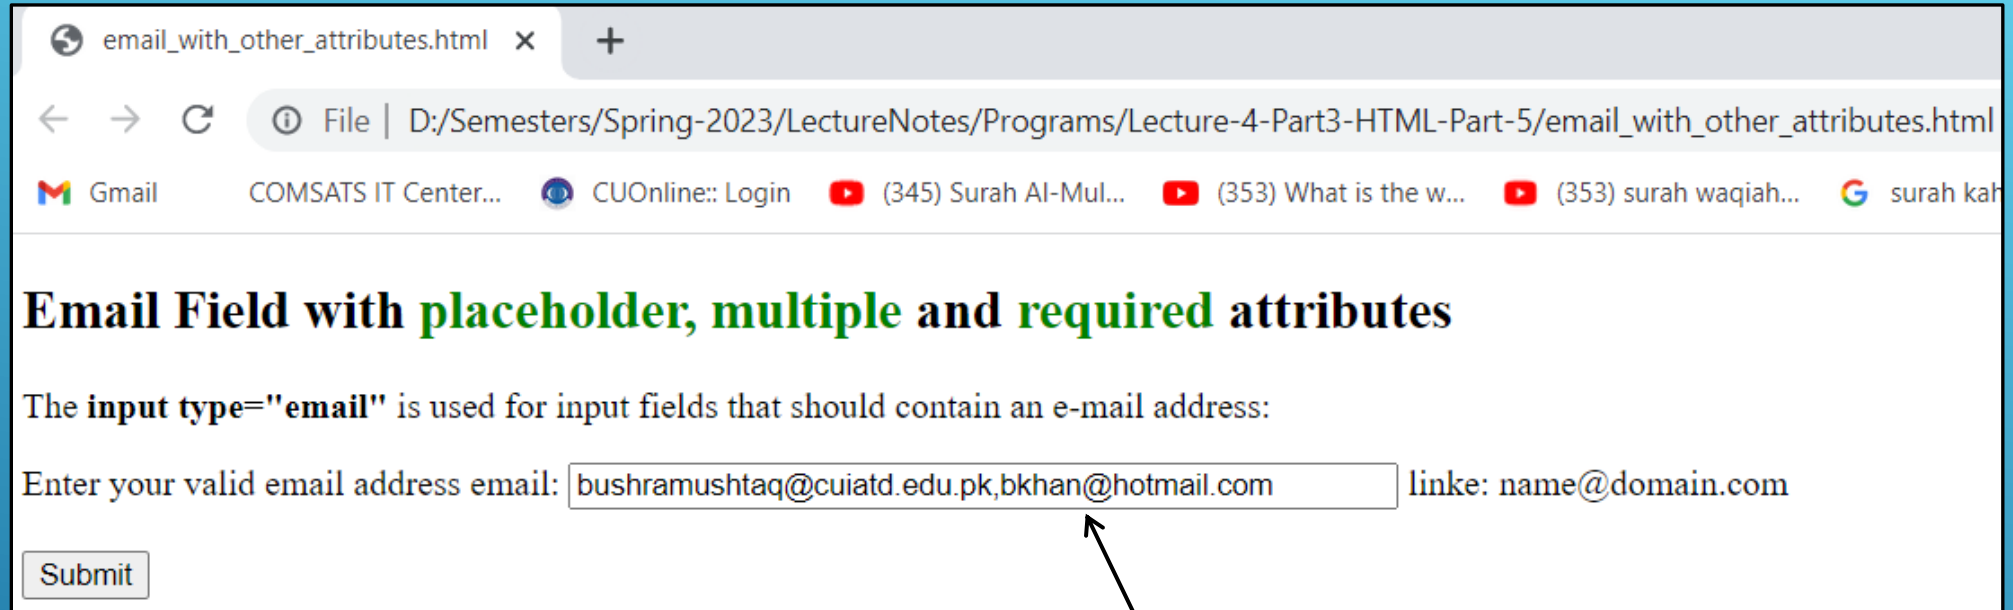

The screenshot shows a web browser window with the address bar displaying "email\_with\_other\_attributes.html". The page title is "Email Field with placeholder, multiple and required attributes". Below the title, a text label reads "The input type='email' is used for input fields that should contain an e-mail address:". Below this, a form label says "Enter your valid email address email:". The input field contains the placeholder text "name@domain.com". To the right of the input field, the text "linke: name@domain.com" is displayed. A "Submit" button is located below the input field. An arrow points from the text "Figure 4.2" to the placeholder text in the input field.

Figure 4.2

- Placeholder allows us to place temporary text in email input field.
- It is only used to give an example of text which user should be entered in this field
- When the user bring the control in this field then placeholder text disappeared.
- Note that when user clicks the “submit” button, Placeholder text does not submitted

# 5. FORM INPUT TYPE-EMAIL

Output-Listing-4.7 use of “multiple” attribute in email input type.

The screenshot shows a web browser window with the address bar displaying 'email\_with\_other\_attributes.html'. The page title is 'Email Field with placeholder, multiple and required attributes'. Below the title, a text label reads 'The input type="email" is used for input fields that should contain an e-mail address:'. Below this, a form label says 'Enter your valid email address email:'. The input field contains the text 'bushramushtaq@cuiatd.edu.pk,bkhan@hotmail.com'. To the right of the input field is a link 'linke: name@domain.com'. A 'Submit' button is located below the input field. A blue callout box with white text explains the 'multiple' attribute, and an arrow points from it to the input field.

email\_with\_other\_attributes.html x +

File | D:/Semesters/Spring-2023/LectureNotes/Programs/Lecture-4-Part3-HTML-Part-5/email\_with\_other\_attributes.html

## Email Field with placeholder, multiple and required attributes

The **input type="email"** is used for input fields that should contain an e-mail address:

Enter your valid email address email:  linke: name@domain.com

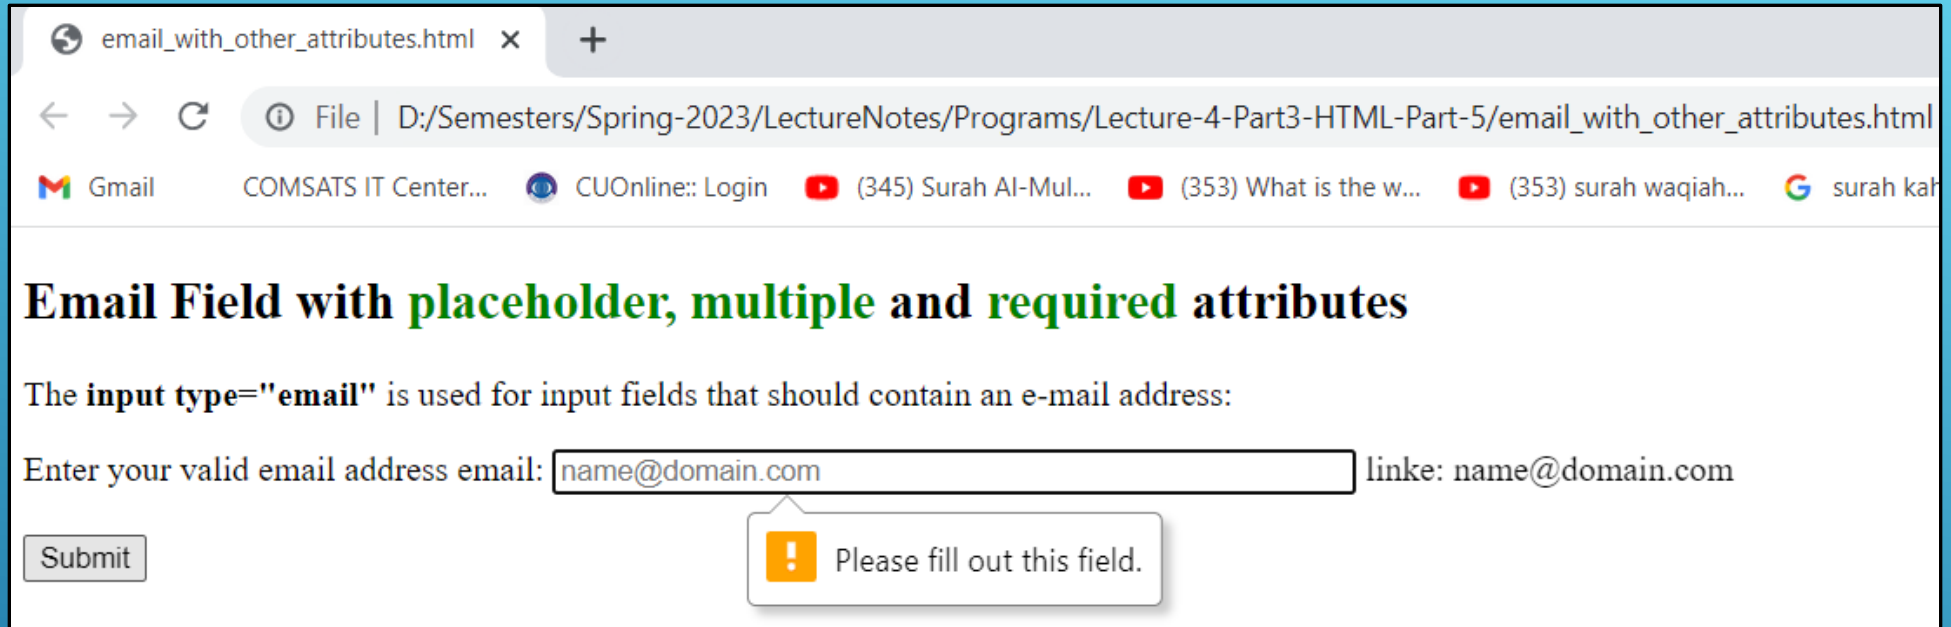

Submit

“multiple” attribute allows the user to enter more than one email addresses separated with comma “,”

Figure 4.3

## 5. FORM INPUT TYPE-EMAIL

Output-Listing-4.7 use of “required” attribute in **email** input type.

The screenshot shows a web browser window with the address bar displaying "email\_with\_other\_attributes.html". The page title is "Email Field with placeholder, multiple and required attributes". The text below the title states: "The **input type='email'** is used for input fields that should contain an e-mail address:". Below this, there is a form with the label "Enter your valid email address email:" followed by an input field containing the placeholder text "name@domain.com". To the right of the input field is the text "linke: name@domain.com". Below the input field is a "Submit" button. A tooltip with an orange exclamation mark icon and the text "Please fill out this field." is pointing to the input field, indicating that the field is required and cannot be left empty.

When user clicked the submit button then “required” attribute does not allow us to leave email field blank because it is required

Figure 4.4

## 6. FORM INPUT TYPE-MONTH

---

- ▶ The email input type enables the user to select a month and year
- ▶ Depending on browser's support the month and year up-down spinner can show up in this field

### Syntax:

**<input type="month" >**

- ▶ Other common attributes id, name, autofocus, min, max and step can be used in input type month ( as shown in table 4.1 and 4.2)
- ▶ IE-21H1, Safari and Firefox do not support month input type
- ▶ Now in next I write a simple program for month display and run in google chrome browser

## 6. FORM INPUT TYPE-MONTH

```
month - Notepad
File Edit Format View Help
<!DOCTYPE html>
<html>
<body>

<h2>Month Field</h2>

<p>The <strong>input type="month"</strong> allows the user to select a <strong><font color="purple">month</font></strong> and
<strong><font color="purple">year</font></strong>.</p>

<form action="/action_page.php">
  <label for="bdaymonth">Birthday (month and year):</label>
  <input type="month" id="bdaymonth" name="bdaymonth">

<br/><br/><input type="submit" value="Submit">
</form>

<p><strong>Note:</strong> type="month" is not supported in Firefox, Safari, or Internet Explorer 21H1 (or earlier).</p>

</body>
</html>
```

Listing 4.8-month.html

## 7. FORM INPUT TYPE-NUMBER

---

- ▶ The number input type defines a numeric input field
- ▶ If browser supports then it enables the user to select a number through up-down spinner
- ▶ Mobile browsers typically display a numeric keypad for number input type

### Syntax:

**<input type="number" >**

- ▶ Other common attributes id, name, autofocus, required, min, max and step can be used in input type number ( as shown in table 4.1 and 4.2)
- ▶ IE-21H1, Safari and Firefox display a text field in which user can input number
- ▶ Google chrome support number type and show up-down spinner, Now in next I write a simple program for number selection and run in google chrome browser

# 7. FORM INPUT TYPE-NUMBER

```
number_with_restrictions - Notepad
File Edit Format View Help
<!DOCTYPE html>
<html>
<body>

<h2>Number Field</h2>

<p>The <strong>input type="number"</strong> defines a numeric input field.</p>

<p>You can use the <strong><font color="red">min</font></strong> and <strong><font color="red">max</font></strong>
attributes to add numeric restrictions in the input field:</p>

<form action="/action_page.php">
  <label for="quantity">Quantity (between 1 and 15):</label>

  <input type="number" id="quantity" name="quantity" min="1" max="15">

<br/><br/><input type="submit" value="Submit">
</form>

</body>
</html>
```

Input restriction for  
minimum value

Listing 4.9 number\_with\_restrions.html

Input restriction for  
maximum value

# 7. FORM INPUT TYPE-NUMBER

The following program displays a numeric input field, where you can enter a value from 0 to 150, in steps of 5. The default value is 20:

```
number_with_restrictions2 - Notepad
File Edit Format View Help
<!DOCTYPE html>
<html>
<body>

<h2>Number Field</h2>

<p>The <strong>input type="number"</strong> defines a numeric input field.</p>

<p>displays a numeric input field, where you can enter a value from <strong><font color="red">0</font></strong> to
<strong><font color="purple">150</font></strong>, in steps of <strong><font color="red">5</font></strong>.
The default value is <strong><font color="green"> 20</font></strong>:
```

Input restriction  
for:

minimum  
value

maximum  
value

Interval  
gap

default  
value

42

## 8. FORM INPUT TYPE-RANGE

---

- ▶ The range input type display a slider control
- ▶ The range control is used for entering a number whose exact value is not important(slider control)
- ▶ Default range is 0 to 100
- ▶ However we can set restriction with **min**, **max** and **set** attributes
- ▶ Default value which will displayed by slider is set by **value** attribute

### Syntax:

**<input type="range" >**

- ▶ Other common attributes id, name, value, autofocus, autocomplete disabled, readonly, **min**, **max** and **step** can be used in input type range ( as shown in table 4.1 and 4.2)
- ▶ IE-21H1, Safari, Firefox and google chrome all support range input type
- ▶ Now in next I write a simple program for range selection and run in both google chrome and IE browsers

## 8. FORM INPUT TYPE-RANGE

range - Notepad  
File Edit Format View Help

```
<!DOCTYPE html>
<html>
<body>

<h2>Range Field</h2>

<p>Depending on browser support: The input type "range" can be displayed as a slider control</p>

<form action="/action_page.php" method="get">
  <p> <label for="length">Length:
    0 <input type="range" id="length" name="length" min="0" max="200" value="50" > 200
  </label></p>

  <br/><br/> <input type="submit" value="Submit">
</form>

</body>
</html>
```

Range minimum value

Range maximum value

Range Default value

Listing 4.11 range.html

## 9. FORM INPUT TYPE-SEARCH

---

- ▶ The search input type is used for search fields
- ▶ The search field behaves like regular text field

### Syntax:

**<input type="search" >**

- ▶ Other common attributes id, name, value, autofocus, autocomplete, disabled, readonly, **size**, required, placeholder and **pattern** can be used in input type search ( as shown in table 4.1 and 4.2)
- ▶ IE-21H1, Safari, Firefox and google chrome support search input type
- ▶ Now in next I write a simple program for search and run in google chrome browser

## 9. FORM INPUT TYPE-SEARCH

```
search - Notepad
File Edit Format View Help
<!DOCTYPE html>
<html>

# 10. FORM INPUT TYPE-TEL

---

- ▶ The tel input type enables the user to input telephone numbers
- ▶ Mobile browsers typically display a keypad specific to entering phone numbers for tel input type

## Syntax:

**<input type="tel" >**

- ▶ As length and format of telephone numbers varies according to location, hence: **HTML5 does not self validate the tel input type**
- ▶ **Pattern** attribute is used to validate the telephone number
- ▶ User put regular expression of relevant format of telephone number in **Pattern** attribute, so the browser checks the user's entered telephone number according to that format and display error message if not matched with regular expression in the **pattern**

## 10. FORM INPUT TYPE-TEL

---

- ▶ Other common attributes id, name, value, autofocus, autocomplete, disabled, readonly, required, placeholder and **pattern** can be used in input type tel ( as shown in table 4.1 and 4.2)
- ▶ IE-21H1, Safari, Firefox and google chrome support tel input type
- ▶ Now in next I write a simple program for input telephone and run in google chrome browser

<h2>Telephone Field</h2>

<p> <strong>The input type "tel"</strong> is used for input <strong><font color="purple">telephone numbers</font></strong>| </p>

<form action="/action_page.php" >

<label for="phone">Enter a phone number:</label><br><br>

<input type="tel" id="phone" name="phone" placeholder="123-45-678" pattern= "[0-9]{3}-[0-9]{2}-[0-9]{3}" required ><br><br>

  <small>Format: 123-45-678</small>

<br/><br/> <input type="submit" value="Submit">
</form>

</body>
</html>
```

“[0-9]{3}” means any 3 digits from 0 to 9

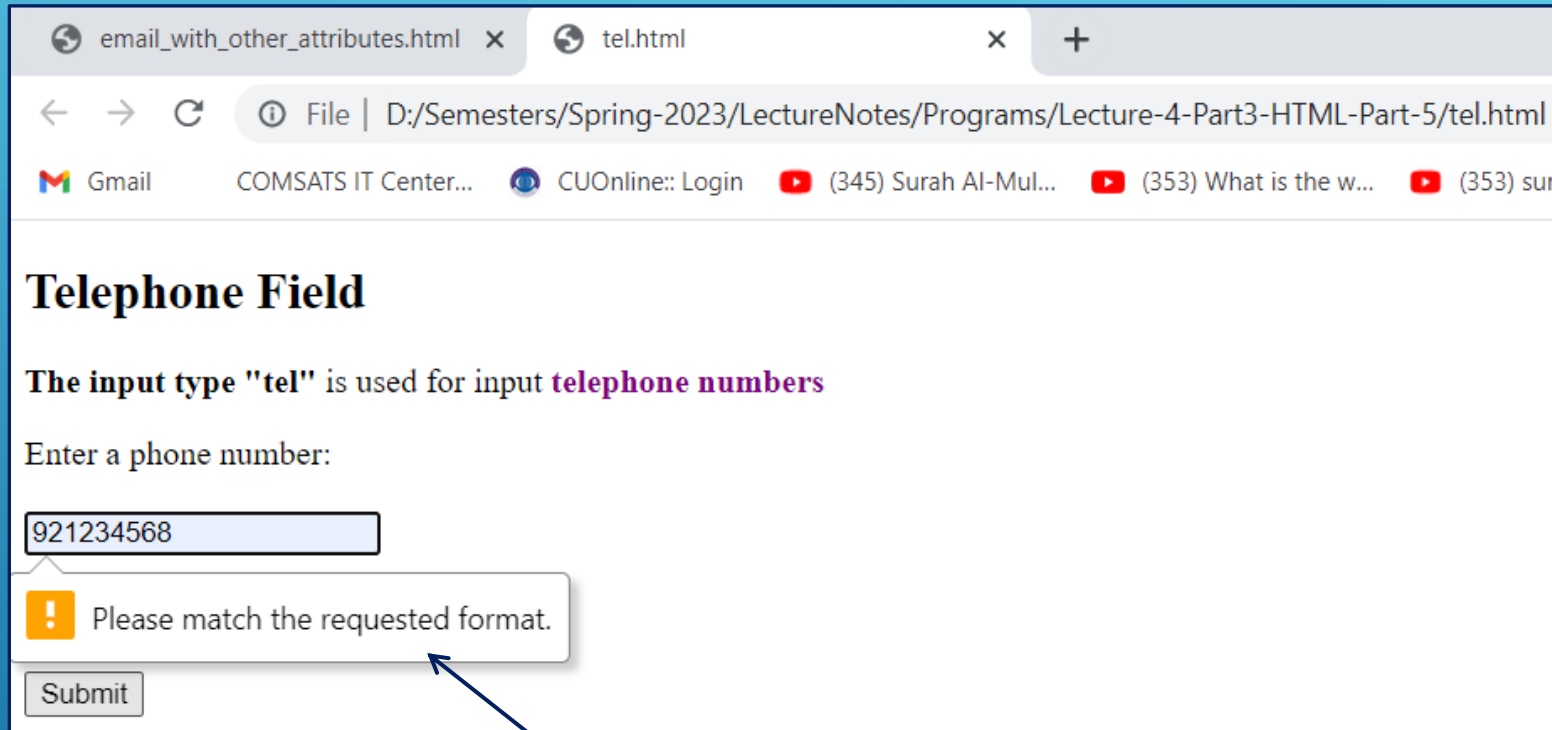

“[0-9]{2}” means any 2 digits from 0 to 9

Pattern describing : 3 digits-2digits-3digits

Listing 4.13-tel.html

# 10. FORM INPUT TYPE-TEL

Output of listing 4.13 by Google chrome

The screenshot shows a web browser window with two tabs: 'email\_with\_other\_attributes.html' and 'tel.html'. The address bar shows the file path 'D:/Semesters/Spring-2023/LectureNotes/Programs/Lecture-4-Part3-HTML-Part-5/tel.html'. The browser's bookmark bar includes 'Gmail', 'COMSATS IT Center...', 'CUOnline:: Login', and several YouTube links. The main content area has the title 'Telephone Field' and a paragraph: 'The input type "tel" is used for input telephone numbers'. Below this is a label 'Enter a phone number:' followed by an input field containing '921234568'. A red error message box with an exclamation mark icon says 'Please match the requested format.' Below the input field is a 'Submit' button. A blue arrow points from the 'Submit' button to a text box on the right.

Figure 4.5-tel.html

As user input telephone number which does not match to the given pattern hence error message displayed after click of submit button

# 11. FORM INPUT TYPE-TIME

---

- ▶ The time input type allows the user to select the time(no time zone)
- ▶ Time is entered in either hh:mm AM/PM or hh:mm:ss.ff formats
- ▶ Depending on browser may or may not display up-down spinner control for time selection

## Syntax:

**<input type="time" >**

- ▶ Other common attributes id, name, value, autofocus, autocomplete, size, disabled, required, placeholder and pattern can be used in input type time ( as shown in table 4.1 and 4.2)
- ▶ IE-11 and later, Safari, Firefox and google chrome support time input type
- ▶ Now in next I write a simple program for input time and run in google chrome browser

# 11. FORM INPUT TYPE-TIME

## 12. FORM INPUT TYPE-URL

---

- ▶ The url input type allows the user to enter the url
- ▶ Depending on browser support, the url can be automatically validated when submitted
- ▶ Some smartphones recognize the url type, and adds ".com" to the keyboard to match url input.

### Syntax:

**<input type="url" >**

- ▶ Other common attributes id, name, value, autofocus, autocomplete, size, disabled, required, placeholder and pattern can be used in input type url ( as shown in table 4.1 and 4.2)
- ▶ IE-11 and later, Safari, Firefox and google chrome support url input type
- ▶ Now in next I write a simple program for input url and run in google chrome browser

## 12. FORM INPUT TYPE-URL

Output of listing 4.15 by Google chrome

The screenshot shows a web browser window with the title "url.html". The address bar displays the file path "D:/Semesters/Spring-2023/LectureNotes/Programs/Lecture-4-Part3-HTML-Part-5/url.html". The browser's tab bar shows several tabs, including "Gmail", "COMSATS IT Center...", "CUOnline:: Login", and two YouTube tabs. The main content area has a heading "Display a URL Input Field" in orange. Below the heading, a text label "The **input type='url'** allows the user to enter url address" is shown. Underneath, a form label "Add your HomePage:" is followed by a text input field containing the text "://sis.cuonlineatd.edu.pk". A "Submit" button is located below the input field. An error message box with an orange exclamation mark icon and the text "Please enter a URL." is displayed below the input field. A blue arrow points from the "Submit" button to the error message box.

Figure 4.27-url.html

Figure 4.6

On click of submit button  
browsers checks the format of  
url, if not valid then gives error  
message

## 13. FORM INPUT TYPE-WEEK

---

- ▶ The week input type allows the user to select a week and year
- ▶ Depending on browser support, up-down spinner control  or (date picker) can show up in the field
- ▶ Week and year is selected as yyyy-Wnn, where nn is 01-53 for example 2020-W17 represents 17<sup>th</sup> week of year 2020

### Syntax:

**<input type="week" >**

- ▶ Other common attributes id, name, autofocus, disabled, required, min, max and step can be used in input type url ( as shown in table 4.1 and 4.2)
- ▶ IE-11, Safari and Firefox display a text field for week input type
- ▶ Google chrome show week and year picker control to select year and week
- ▶ Now in next I write a simple program for input week and run in google chrome browser

## File upload

Show a file-select field which allows a file to be chosen for upload:

Select a file:

Submit

When user clicks “choose File” button then browse dialogue for file upload become opened

# AUTOCOMPLETE ATTRIBUTE

---

- ▶ The autocomplete attribute can be used on almost all input types you study so far in **Lecture-4-Part2-HTML-Part4** and in **current Lecture** to automatically fill in the user's information based on previous input—such as name, address or e-mail.
- ▶ You can also enable autocomplete for an **entire form** or just for specific elements.
- ▶ For entire form you have to write autocomplete=“on” in form tag as shown in line#17 in Listing-4.8(a)
- ▶ To disable autocomplete in any of input control like password field: write autocomplete=“off” in tag of that input field.

# DATALIST INSERTION IN TEXT FIELD

---

- ▶ Datalist element is a new form element provided by html5 for list of values.
- ▶ Datalist provides input options for a **text input field**.

## How to put datalist in text field:

1. First create a text input field and assign the datalist id name in the **list** attribute of text field—line#31 in listing 4.18(b)
2. Secondly create a datalist with same id as gave in list attribute in text field. Put all options in this datalist.---line#(33-46) in listing 4.18(b)

# AUTOCOMPLETE ATTRIBUTE

```
1  <!DOCTYPE html>
2
3  <!-- Listing. 4.18: autocomplete_and_datalist.html -->
4  <!-- New HTML5 form autocomplete attribute and datalist element. -->
5  <html>
6  <head> <meta charset="utf-8">
7  <title>New HTML5 autocomplete Attribute and datalist Element</title>
8  </head>
9
10 <body>
11 <h1><font color="blue">Autocomplete and Datalist Demo</font></h1>
12 <p><h3><font color="red">This form demonstrates the new HTML5 autocomplete attribute
13     and the datalist element</font></h3>
14     </p>
15
16 <!-- turn autocomplete on -->
17 <form method = "post" autocomplete="on">
18   <p><label for="firstName">First Name:
19     <input type = "text" id = "firstName" placeholder = "First name" /> (First name)
20   </label></p>
21
22   <p><label>Last Name:
23     <input type = "text" id = "lastName" placeholder = "Last name"/> (Last name)
24   </label></p>
25
26   <p><label>Email:
27     <input type = "email" id = "email" placeholder = "name@domain.com"/> (name@domain.com)
28   </label></p>
```

Autocomplete="on" for  
entire form elements

Value of "placeholder" will be displayed  
in input fields when form displayed in  
browser

Listing-4.18(a)

# DATALIST ELEMENT

```
29
30 <p><label for = "txtList">Birth Month:
31 <input type = "text" id = "txtList" placeholder = "Select a month" list = "months" />
32
33 <datalist id = "months">
34     <option value = "January">
35     <option value = "February">
36     <option value = "March">
37     <option value = "April">
38     <option value = "May">
39     <option value = "June">
40     <option value = "July">
41     <option value = "August">
42     <option value = "September">
43     <option value = "October">
44     <option value = "November">
45     <option value = "December">
46 </datalist>
47 </label></p>
48
49 <p><input type = "submit" value = "Submit" />
50 <input type = "reset" value = "Clear" /></p>
51 </form>
52 </body>
53 </html>
```

The diagram consists of two callout boxes. The top box is blue and contains the text: "datalist 'id' name is placed in 'list' attribute of text input field". An arrow points from this box to the `list = "months"` attribute in line 31 of the code. Another arrow points from the same box to the `<datalist id = "months">` line in line 33. The bottom box is yellow and contains the text: "In this way datalist options will be inserted as drop down list in text field". An arrow points from the top box down to this box.
